Constituent Parsing  (3/9)

CS 690N, Spring 2017
Advanced Natural Language Processing
http://people.cs.umass.edu/~brenocon/anlp2017/

Brendan O’Connor
College of Information and Computer Sciences
University of Massachusetts Amherst
• PCFG and CRF-CFG models:
  • Only allow interactions between parents and direct children
  • Key enhancement: state splitting to propagate information from above and below
• Extension: use unlabeled data
• Alternatives
  • Whole-tree models
  • History-based models
Semi-supervised training

- **Data**
  - Labeled data \((x,y)\) pairs +
  - Unlabeled data \((x)\)
- **EM for semi-supervised learning**
  - Initialize with supervised model on labeled data
  - Assume latent \(y\) for unlabeled data; optimize total log-likelihood
  - Well-defined only for generative models
  - Trickiness with objective balancing
- **Self-training**: just use 1-best inferences on unlabeled data ("hard EM")
  - Variants: only use high-confidence predictions... etc.
  - "Bootstrapping" / "Bootstrapped learning"
- **Improves performance** [McClosky et al. 2006]
Discriminative re-ranking

- No more PCFG: Why not use a log-linear model with whole-tree features?
  - Now CKY is no longer possible. Why?
- Make it fast with **re-ranking**:
  - Take top-K trees from a PCFG.
  - Extract features for each, and re-rank them.
- Re-ranking is a very powerful general technique in NLP
  - Simple, fast model generates candidates
  - Slow, more accurate model decides the best one
Whole-tree discrim. models

- Log-linear features [Johnson and Charniak 2005]
  - Does this NP contain 15-20 words? Right-branching tendencies?
- Tree-structured recursive NNs [Socher et al. 2013]
  - Compare to head rules for lexicalization
  - Alternate application: hierarchical phrase sentiment analysis

Discrete Syntactic – Continuous Semantic Representations in the Compositional Vector Grammar

Shift-reduce parsing

- One form of left-to-right / top-down parsing
- Incrementally build up the parse tree, scanning words left-to-right.
  - Parser as a state machine
- No dynamic programming! $O(n)$ runtime!
- Potentially related to cognitive processing?
- Most practically efficient for constituent parsing -- e.g. zpar and CoreNLP implementations
Example from a similar incremental parser (slightly different than current work)

</tr>
</tbody>
</table>

![Figure 4: Joint generation of a parse tree and sentence.](image)
Shift-reduce parsing

- Models for shift-reduce
  - Any (P)CFG can be parsed in this manner \[\text{[Stolcke 1995]}\]
- History based models: select next action given information about current state and history
  - Infinite history, no future (contrast to PCFG assumptions!)
- \(a\): action
- \(u\): features/embedding of current state
- Generative form (discriminative also possible):

\[
p(x, y) = \prod_{t=1}^{\left|a(x, y)\right|} p(a_t \mid a_{<t})
= \prod_{t=1}^{\left|a(x, y)\right|} \frac{\exp \mathbf{r}_{a_t}^\top \mathbf{u}_t + b_{a_t}}{\sum_{a' \in A_G(T_t, S_t, n_t)} \exp \mathbf{r}_{a'}^\top \mathbf{u}_t + b_{a'}}
\]

\[\text{[Dyer et al. 2016]}\]
• Vector representation of current stack/buffer state
• Explicit log-linear features over the current stack, buffer etc. [Ratnaparkhi 1998, Zhang+Clark 2011]
• Neural network representation of current state [e.g. Henderson 2004, Dyer et al. 2016, Bowman et al. 2016]
• Training: extract oracle decisions paths from labeled data
• Generative model: use importance sampling to calculate feature expectations

Figure 5: Neural architecture for defining a distribution over \( a_t \) given representations of the stack \( (S_t) \), output buffer \( (T_t) \) and history of actions \( (\alpha_{<t}) \). Details of the composition architecture of the NP, the action history LSTM, and the other elements of the stack are not shown. This architecture corresponds to the generator state at line 7 of Figure 4.

[Dyer et al. 2016]

Table 6: Parsing results on CTB 5.1 including results with the buggy composition function implementation (indicated by †) and with the correct implementation.
Look out for bugs.

Due to an implementation bug in the RNNG’s recursive composition function, the results reported in Dyer et al. (2016) did not correspond to the model as it was presented. This corri-

- Even the experts have bugs!
- Many, MANY unreported bugs in results are likely out there
- Replication and reimplementation are often good ways of finding them
