Factorization and Markov Properties

### Markov Properties for Undirected Graphical Model

Undirected graphical models are probability distributions that satisfy a set of conditional independence properties with respect to a dependence graph  $\mathcal{G}$ . Formally:

- ▶ Let  $\mathcal{G} = (V, E)$  be a graph with nodes  $V = \{1, \dots, n\}$
- ▶ For  $A, B, S \subseteq V$ , say that S separates A from B if all paths from A to B in  $\mathcal{G}$  go through S, written  $sep_{\mathcal{G}}(A, B|S)$ .

The joint distribution of random variables  $X_1, \ldots, X_n$  satsifes the **global Markov property** with respect to  $\mathcal{G}$  if

$$sep_G(A, B|S) \implies \mathbf{X}_A \perp \mathbf{X}_B \mid \mathbf{X}_S \tag{G}$$

What form of distribution  $p(x_1, ..., x_n)$  has this property?

# Warmup: Characterization of Conditional Independence

Recall the definition of conditional independence

$$\mathbf{X} \perp \mathbf{Y} \mid \mathbf{Z} \iff p(\mathbf{x}, \mathbf{y} | \mathbf{z}) = p(\mathbf{x} | \mathbf{z}) p(\mathbf{y} | \mathbf{z})$$

Today we'll use two other properties of conditional independence:

1. 
$$\mathbf{X} \perp \mathbf{Y} \mid \mathbf{Z} \iff p(\mathbf{x}, \mathbf{y}, \mathbf{z}) = \phi_1(\mathbf{x}, \mathbf{z})\phi_2(\mathbf{y}, \mathbf{z})$$
 for some  $\phi_1, \phi_2$   
2.  $\mathbf{X} \perp (\mathbf{Y}, \mathbf{W}) \mid \mathbf{Z} \implies \mathbf{X} \perp \mathbf{Y} \mid \mathbf{Z}$ 

Proofs: exercise

Note: (1) says that conditional independence holds iff the joint distribution factorizes in a certain way, which is very important.

Markov Random Field Example

**Example**:  $p(x_1, x_2, x_3, x_4) = \phi_{12}(x_1, x_2)\phi_{23}(x_2, x_3)\phi_{34}(x_3, x_4)\phi_{14}(x_1, x_4)$

Markov Random Fields 0000●0 Factorization and Markov Properties

#### Markov Random Fields

A Markov random field is a probability distribution that factorizes over a set of "cliques"  $\mathcal{C}$ :

$$p(\mathbf{x}) = \frac{1}{Z} \prod_{c \in \mathcal{C}} \phi_c(\mathbf{x}_c), \quad Z = \sum_{\mathbf{x}} \prod_{c \in \mathcal{C}} \phi_c(\mathbf{x}_c)$$

- ▶ Each  $c \subseteq V = \{1, ..., n\}$  is a set of indices, or "clique"
- ▶ The function  $\phi_c$  is a non-negative factor or potential. It only depends on  $x_i$  for  $i \in c$ . We say it has  $scope\ c$  and define  $Scope(\phi_c) := c$
- ightharpoonup Z is the normalizing constant or "partition function"

Motivation

Markov Random Fields 00000● Factorization and Markov Properties 0000000000

# Dependence Graph

The dependence graph  $\mathcal{G}=(V,E)$  of the MRF  $p(\mathbf{x})=\frac{1}{Z}\prod_{c\in\mathcal{C}}\phi_c(\mathbf{x}_c)$  is the graph where nodes i and j are connected by an edge if they appear together in some factor:

$$V = \{1, \dots, n\}, \quad E = \{(i, j) : i \in c \text{ and } j \in c \text{ for some } c \in \mathcal{C}\}$$

With this definition, every  $c \in \mathcal{C}$  is a clique (fully connected set) in  $\mathcal{G}$ .

Motivation 0000 Markov Random Fields

Factorization and Markov Properties

000

Markov Random Fields

Factorization and Markov Properties

#### **Factorization**

Let  $\mathcal{G}$  be a graph. A distribution  $p(\mathbf{x})$  factorizes with respect to  $\mathcal{G}$  if

$$p(\mathbf{x}) = \frac{1}{Z} \prod_{c \in \mathcal{C}} \phi_c(\mathbf{x}_c), \quad \mathcal{C} = \mathsf{cliques}(\mathcal{G}) \tag{F}$$

In other words, it is an MRF with dependence graph  $\mathcal{G}$ .

As in Bayes nets, there is a close relationship between factorization and Markov properties obtained from graph separation.

### Markov Properties

The global Markov property (G), the local Markov Property (L) and pairwise Markov property (P) are three different properties of a distribution that hold relative to a graph G.

$$sep_{\mathcal{G}}(A, B|S) \implies \mathbf{X}_A \perp \mathbf{X}_B \mid \mathbf{X}_S \tag{G}$$

$$i \in V \implies X_i \perp \mathbf{X}_{V \setminus (\mathsf{nb}(i) \cup \{i\})} \mid \mathbf{X}_{\mathsf{nb}(i)}$$
 (L)

$$(i,j) \notin E \implies X_i \perp X_j \mid \mathbf{X}_{V \setminus \{i,j\}}$$
 (P)

Above, nb(i) is the set of neighbors of node i in G.

Claim:  $(G) \Rightarrow (L) \Rightarrow (P)$ 

It's easy to see (G)  $\Rightarrow$  (L) and (G)  $\Rightarrow$  (P) by taking the appropriate choices of A, B, S. We leave (L)  $\Rightarrow$  (P) as an exercise.

### Factorization Implies Markov

Like in Bayes nets, factorization implies conditional independencies (Markov properties).

Claim:  $(F) \Rightarrow (G) \Rightarrow (L) \Rightarrow (P)$ 

**Proof** ("by example"): We only need to show  $(F) \Rightarrow (G)$ .

Factorization Implies Markov Proof

18 / 22

17 / 22

Motivation

Markov Random Fields

Factorization and Markov Properties

### Factorization Implies Markov Proof

Suppose  $p(\mathbf{x}) = \prod_{c \in \mathcal{C}} \phi_c(\mathbf{x}_c)$  (assume 1/Z is included in one of the factors) and  $\sup_{\mathcal{G}}(A,B;S)$ . We'll show that  $\mathbf{X}_A \perp \mathbf{X}_B \mid \mathbf{X}_S$ .

First, remove S from  $\mathcal G.$  The resulting graph is disconnected and has no paths from A to B

- $\blacktriangleright$  Let  $\tilde{A}$  be the union of all connected components containing a node from A
- $\blacktriangleright \ \operatorname{Let} \, \tilde{B} = V \setminus \tilde{A}$

Then each  $c \in \mathcal{C}$  is a subset of either  $\tilde{A} \cup S$  or  $\tilde{B} \cup S$ 

- ▶ Let  $C_A$  be the cliques contained in  $\tilde{A} \cup S$
- ▶ Let  $\mathcal{C}_B$  be the cliques contained in  $\tilde{B} \cup S$

20 / 22

Then

$$\begin{aligned} p(\mathbf{x}) &= \prod_{c \in \mathcal{C}_A} \phi_c(\mathbf{x}_c) \prod_{c \in \mathcal{C}_B} \phi_c(\mathbf{x}_c) = h(\mathbf{x}_{\tilde{A}}, \mathbf{x}_S) k(\mathbf{x}_{\tilde{B}}, \mathbf{x}_S) \\ &\implies \mathbf{X}_{\tilde{A}} \perp \mathbf{X}_{\tilde{B}} \mid \mathbf{X}_S \\ &\iff (\mathbf{X}_A, \mathbf{X}_{\tilde{A} \setminus A}) \perp (\mathbf{X}_B, \mathbf{X}_{\tilde{B} \setminus B}) \mid \mathbf{X}_S \\ &\implies \mathbf{X}_A \perp \mathbf{X}_B \mid \mathbf{X}_S \end{aligned}$$

## Markov Implies Factorization: Hammersley-Clifford Theorem

There is a famous partial converse. For a *positive* distribution, (P)  $\Rightarrow$  (F), which implies all the conditions are equivalent:

**Theorem (Hammersley-Clifford).** If  $p(\mathbf{x}) > 0$  for all  $\mathbf{x}$ , then

$$(F) \iff (G) \iff (L) \iff (P).$$

The theorem holds for a very general class of distributions, e.g., ones with continuous, discrete, or both types of random variables.
