

Crowdsourced Discovery of Fine-grained Attributes

Subhransu Maji

Toyota Technological Institute at Chicago

Overview

Goals

Attribute discovery for fine-grained and detailed recognition of visual categories.

Approach

- A novel annotation framework to collect descriptions of a collection of images
- A novel analysis of the text to discover the structure of parts and attributes

Key idea

- A good set of attributes should enable easy *discrimination* between instances
- We also focus on the *communication* aspect which is important for human-computer interaction

Sources of attributes

Field guides

- Can provide an exhaustive list of attributes when available, but may not be task specific, or jargon free

Captioned images on the web

- Descriptions are often not visual
- Detailed captions are available only for few categories

Dazzle after dark with Judith Leiber's decadent oversized crystal-embellished silver-tone clutch. Carry this fabulous extra to add high-octane glamour to an LBD and leotard heels. Shown here with an Emilio Pucci dress and Givenchy shoes.

The 12K pink and green gold leaves gently cascade down on these delicate beaded 10K gold earrings.

Rock and roll in these sexy, strappy heels from Report Signature. The smoldering Rockwell features a grey patent leather upper with gleaming satin crossing at the open-toe atop a 1 inch platform, patent straps closing around the ankle with a gold buckle, and finally a 5 inch patent cone heel. Sizzle in these fierce mile-high shoes.

We crowdsourced attribute discovery

- Using a simple interface that we found to be very effective

Our approach

Annotation task

- Describe the visual differences between the two images
- The annotators list 5 differences between the images in short sentences separated by v.s.

list properties

- plane
- has engine
- red color
- has rudder

list differences

- propeller plane vs. passenger plane
- one engine vs. four engines
- red color vs. white color
- round rudder vs. pointy rudder

Description vs. Discriminative description

- Annotators are forced to reveal detailed attributes which are useful for fine-grained discrimination by design
- Also provides us with sentence pairs that can be analyzed to discover the structure of attributes, e.g., parts, modifiers and their relations.

Collecting annotations

Interface on Amazon Mechanical Turk

- Users respond in free form text

We also provide a few example annotations

- yellow and red rudder vs blue rudder
- two wings vs one wing
- yellow body vs blue body
- facing right vs facing left

- left facing vs right facing
- red rudder vs white rudder
- passenger plane vs propeller plane
- wings near bottom vs wings on top
- two side engines vs one side engine

We collect annotations for random pairs of images

- If an attribute is present with probability p , then it is likely to be revealed in a pair with probability $p(1-p)$, which is highest for $p=0.5$, i.e. the most discriminative attribute

Example annotations collected

Analyzing the text

Instance specific properties

- Different properties are revealed in different comparisons
- The frequency of an attribute is a measure of its discriminative ability

[From Wikipedia] **Florida jay:** It has a strong black bill, blue head and nape without a crest, a whitish forehead and *supercilium*, blue bib, blue wings, grayish underparts, gray back, long blue tail, black legs and feet.

Analyzing the sentence pairs

- Sentence pairs provide additional structure over the words used
 - parts*: words that repeat across a pair
 - modifiers*: words that are different across a pair
- Can also be obtained using part-of-speech taggers
- A sentence pair is more informative than two sentences in isolation
 - Additional constraint*: the modifiers belong from the same category
 - In the example below, red and white must be two kinds of the same thing (color in this case).

Example

red rudder vs. white rudder → rudder {red, white}
 pointy nose vs. round nose → nose {pointy, round}
 sentence pairs → parts modifiers

A generative model of sentence pairs

Discovering parts, modifiers and attributes

- The constraints described earlier can be captured using a generative bipartite-topic model.

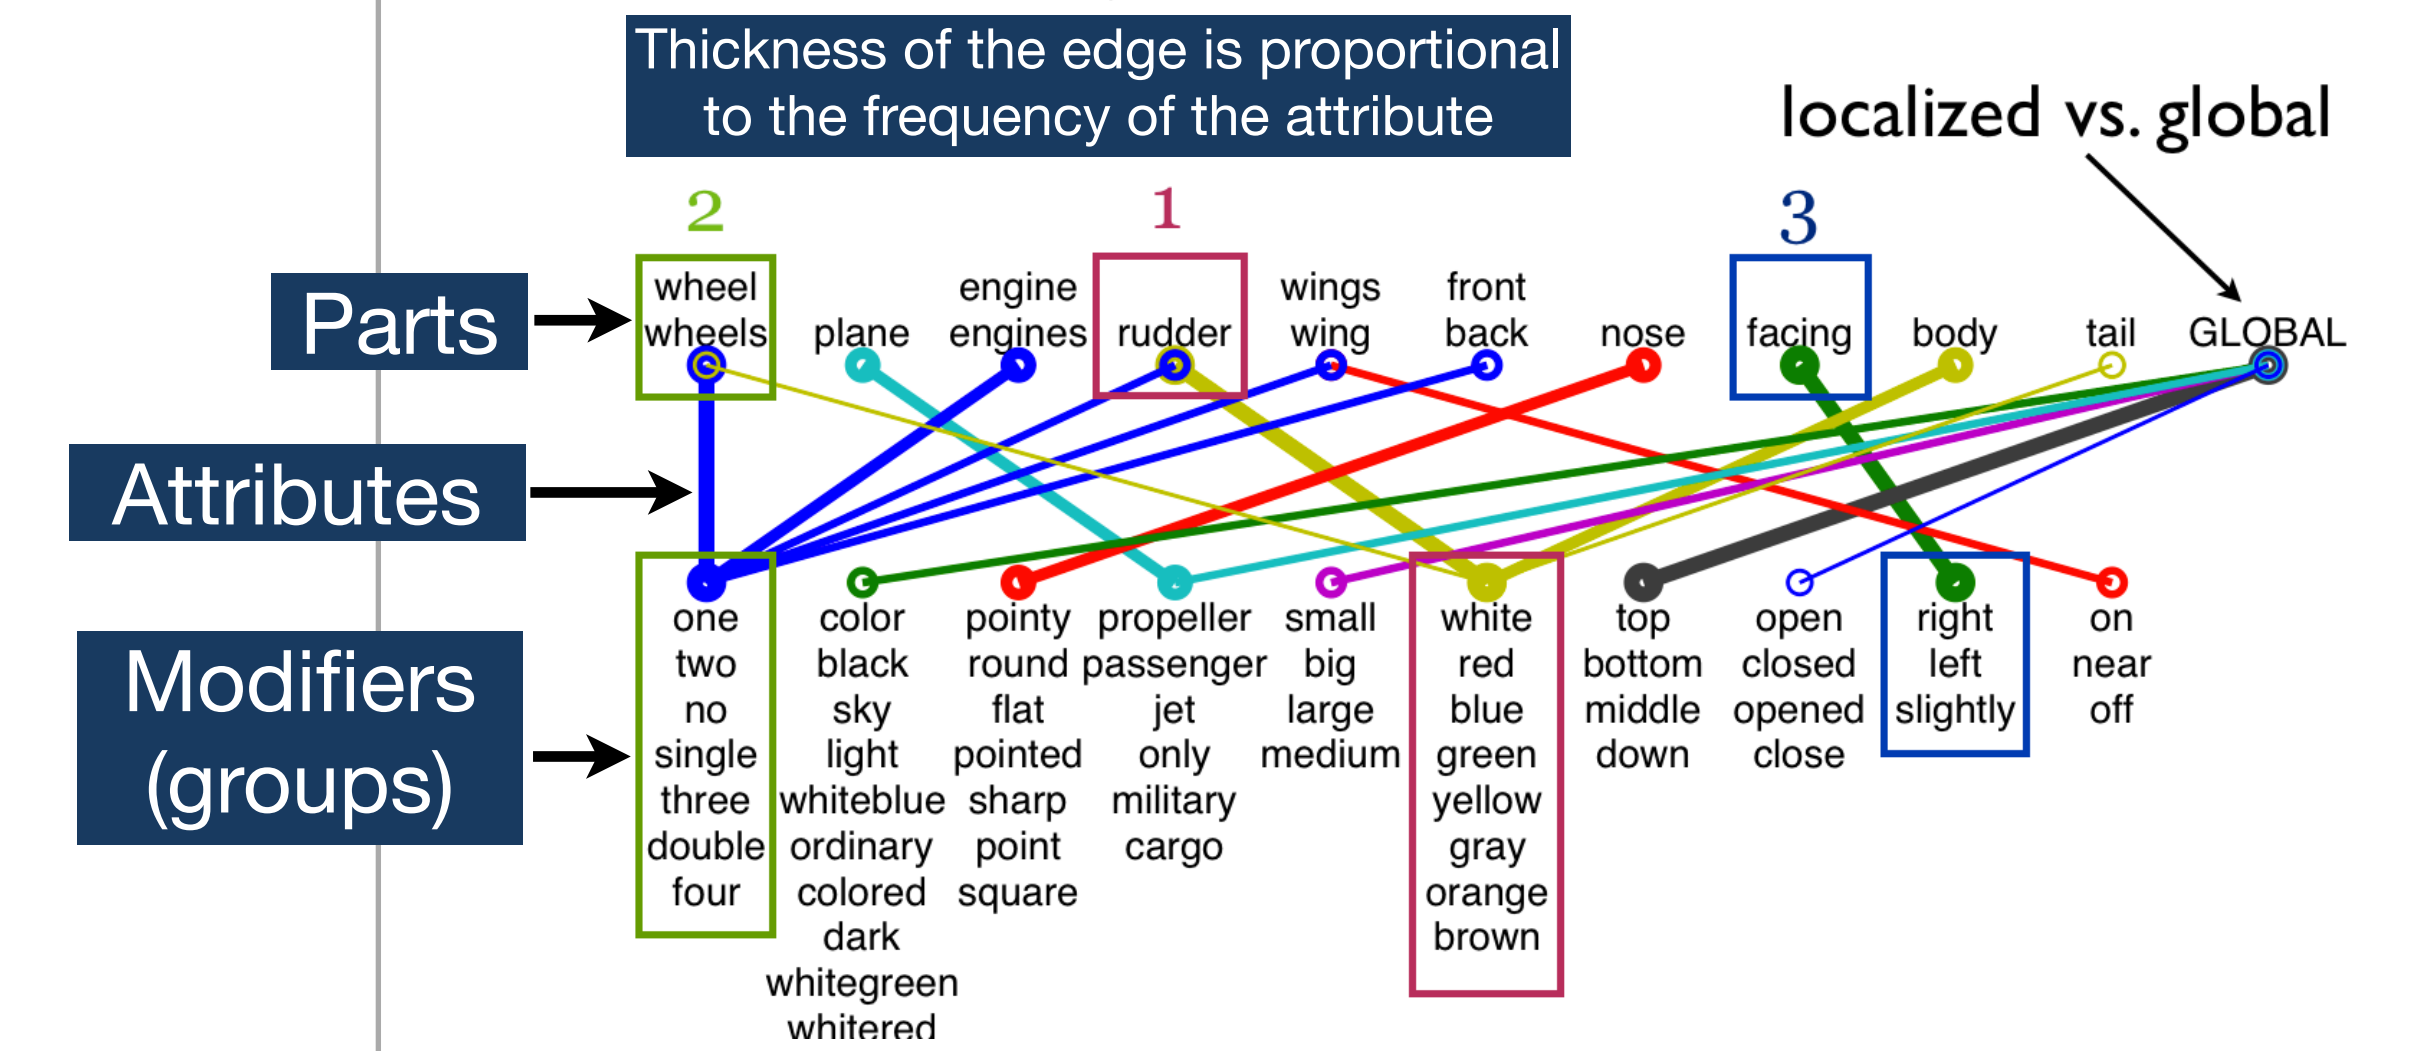

- Parameter estimation using variational EM algorithm

Experiments

FGVC-Aircraft dataset (see our other poster)

- 200 random images, 1000 random pairs

Caltech-UCSD birds 200 dataset

- 200 images (1 per category), 1600 pairs

PASCAL VOC 2011 person dataset

- 200 images from trainval subset, 1600 pairs
