

Context Free Grammar

CS 585, Fall 2017

Introduction to Natural Language Processing
<http://people.cs.umass.edu/~brenocon/inlp2017>

Brendan O'Connor

College of Information and Computer Sciences
University of Massachusetts Amherst

- Syntax: how do words structurally combine to form sentences and meaning?
- Representations
 - Constituents
 - [the big dogs] chase cats
 - [colorless green clouds] chase cats
 - Dependencies
 - The **dog chased** the cat.
 - My **dog**, a big old one, **chased** the cat.
- Idea of a *grammar* (G): global template for how sentences / utterances / phrases w are formed, via latent syntactic structure y
 - Linguistics: what do G and $P(w, y \mid G)$ look like?
 - Generation: score with, or sample from, $P(w, y \mid G)$
 - Parsing: predict $P(y \mid w, G)$

Is language context-free?

Is language context-free?

- Regular language: repetition of repeated structures

Is language context-free?

- Regular language: repetition of repeated structures
- e.g. Justeson and Katz (1995)'s noun phrase pattern:
(Noun | Adj)* Noun (Prep Det? (Noun | Adj)* Noun)*

Is language context-free?

- Regular language: repetition of repeated structures
 - e.g. Justeson and Katz (1995)'s noun phrase pattern:
(Noun | Adj)* Noun (Prep Det? (Noun | Adj)* Noun)*
- Context-free: hierarchical recursion

Is language context-free?

- Regular language: repetition of repeated structures
 - e.g. Justeson and Katz (1995)'s noun phrase pattern:
(Noun | Adj)* Noun (Prep Det? (Noun | Adj)* Noun)*
- Context-free: hierarchical recursion
- Center-embedding: classic theoretical argument for CFG vs. regular languages

Is language context-free?

- Regular language: repetition of repeated structures
 - e.g. Justeson and Katz (1995)'s noun phrase pattern:
(Noun | Adj)* Noun (Prep Det? (Noun | Adj)* Noun)*
- Context-free: hierarchical recursion
- Center-embedding: classic theoretical argument for CFG vs. regular languages
 - (10.1) The cat is fat.

Is language context-free?

- Regular language: repetition of repeated structures
 - e.g. Justeson and Katz (1995)'s noun phrase pattern:
(Noun | Adj)* Noun (Prep Det? (Noun | Adj)* Noun)*
- Context-free: hierarchical recursion
- Center-embedding: classic theoretical argument for CFG vs. regular languages
 - (10.1) The cat is fat.
 - (10.2) The cat that the dog chased is fat.

Is language context-free?

- Regular language: repetition of repeated structures
 - e.g. Justeson and Katz (1995)'s noun phrase pattern:
(Noun | Adj)* Noun (Prep Det? (Noun | Adj)* Noun)*
- Context-free: hierarchical recursion
- Center-embedding: classic theoretical argument for CFG vs. regular languages
 - (10.1) The cat is fat.
 - (10.2) The cat that the dog chased is fat.
 - (10.3) *The cat that the dog is fat.

Is language context-free?

- Regular language: repetition of repeated structures
 - e.g. Justeson and Katz (1995)'s noun phrase pattern:
(Noun | Adj)* Noun (Prep Det? (Noun | Adj)* Noun)*
- Context-free: hierarchical recursion
- Center-embedding: classic theoretical argument for CFG vs. regular languages
 - (10.1) The cat is fat.
 - (10.2) The cat that the dog chased is fat.
 - (10.3) *The cat that the dog is fat.
 - (10.4) The cat that the dog that the monkey kissed chased is fat.

Is language context-free?

- Regular language: repetition of repeated structures
 - e.g. Justeson and Katz (1995)'s noun phrase pattern:
(Noun | Adj)* Noun (Prep Det? (Noun | Adj)* Noun)*
- Context-free: hierarchical recursion
- Center-embedding: classic theoretical argument for CFG vs. regular languages
 - (10.1) The cat is fat.
 - (10.2) The cat that the dog chased is fat.
 - (10.3) *The cat that the dog is fat.
 - (10.4) The cat that the dog that the monkey kissed chased is fat.
 - (10.5) *The cat that the dog that the monkey chased is fat.

Is language context-free?

- Regular language: repetition of repeated structures
 - e.g. Justeson and Katz (1995)'s noun phrase pattern:
(Noun | Adj)* Noun (Prep Det? (Noun | Adj)* Noun)*
- Context-free: hierarchical recursion
- Center-embedding: classic theoretical argument for CFG vs. regular languages
 - (10.1) The cat is fat.
 - (10.2) The cat that the dog chased is fat.
 - (10.3) *The cat that the dog is fat.
 - (10.4) The cat that the dog that the monkey kissed chased is fat.
 - (10.5) *The cat that the dog that the monkey chased is fat.
- Competence vs. Performance?

Hierarchical view of syntax

- “a Sentence made of Noun Phrase followed by a Verb Phrase”

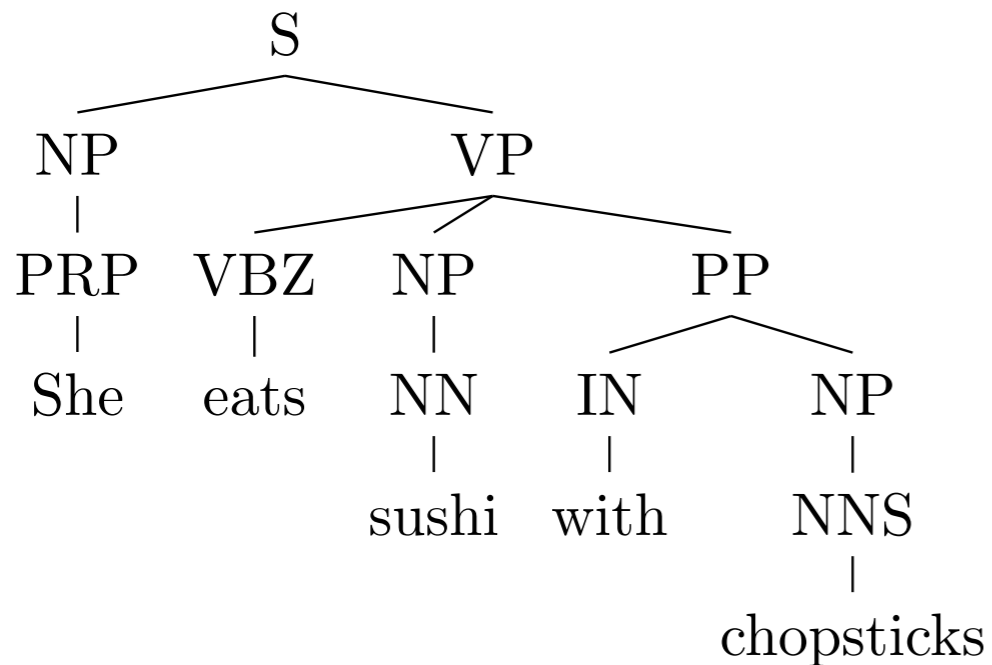

b. $S \rightarrow NP VP$ (1)

Is language context-free?

- Practical examples where nesting seems like a useful explanation
- *The **processor** has 10 million times fewer transistors on it than today's typical micro-processors, runs much more slowly, and operates at five times the voltage...*
- - $S \rightarrow NN VP$
 - $VP \rightarrow VP3S \mid VPN3S \mid \dots$
 - $VP3S \rightarrow VP3S, VP3S, \text{ and } VP3S \mid VBZ \mid VBZ NP \mid \dots$

- Regular language \Leftrightarrow RegEx \Leftrightarrow paths in finite state machine
- Context-free language \Leftrightarrow CFG \Leftrightarrow derivations in pushdown automaton
- A context-free grammar is a 4-tuple:
 - N a set of non-terminals
 - Σ a set of terminals (distinct from N)
 - R a set of productions, each of the form $A \rightarrow \beta$,
where $A \in N$ and $\beta \in (\Sigma \cup N)^*$
 - S a designated start symbol
- Derivation: sequence of rewrite steps from S to a string (sequence of terminals, i.e. words)
- Yield: the final string
- A CFG is a “boolean language model”
- A probabilistic CFG is a probabilistic language model:
 - Every production rule has a probability; defines prob dist. over strings.

Example

(S(NP(PRP *She*)(VP(VBZ *eats*)
(NP(NN *sushi*))
(PP(IN *with*)(NP(NNS *chopsticks*))))))

- All useful grammars are *ambiguous*: multiple derivations with same yield
- [Parse tree representations: Nested parens or non-terminal spans]

Example

(S(NP(_{PRP} She))(VP(_{VBZ} eats)

(NP(_{NN} sushi))

(PP(_{IN} with)(NP(_{NNS} chopsticks))))))

(S(NP(_{PRP} She))(VP(_{VBZ} eats)

(NP(NP(_{NN} sushi))(PP(_{IN} with)(NP(_{NNS} chopsticks))))))

- All useful grammars are *ambiguous*: multiple derivations with same yield
- [Parse tree representations: Nested parens or non-terminal spans]

Constituents

- Constituent tree/parse is one representation of sentence's syntax. What should be considered a constituent, or constituents of the same category?
 - Substitution tests
 - Pronoun substitution
 - Coordination tests
- Simple grammar of English
 - Must balance *overgeneration* versus *undergeneration*
 - Noun phrases
 - NP modification: adjectives, PPs
 - Verb phrases
 - Coordination...

- stopped here 11/14

Parsing with a CFG

- Task: given text and a CFG, answer:
 - Does there exist at least one parse?
 - Enumerate parses (backpointers)
- Cocke-Kasami-Younger algorithm
 - Bottom-up dynamic programming:
Find possible nonterminals for short spans of sentence, then possible combinations for higher spans
 - Requires converting CFG to Chomsky Normal Form (a.k.a. binarization)

CKY

Grammar

Adj \rightarrow yummy

NP \rightarrow foods

NP \rightarrow store

NP \rightarrow NP NP

NP \rightarrow Adj NP

For cell $[i,j]$ (loop through them bottom-up)

For possible splitpoint $k=(i+1)..(j-1)$:

For every B in $[i,k]$ and C in $[k,j]$,

If exists rule $A \rightarrow B C$,

add A to cell $[i,j]$ (Recognizer)

... or ...

add (A,B,C, k) to cell $[i,j]$ (Parser)

Recognizer: per span, record list of possible nonterminals

Parser: per span, record possible ways the nonterminal was constructed.
