CS 621 **Course Overview:** Static and Dynamic Analyses

Why is it important to study software engineering?

Last time

What did we talk about?

#### Just like cars

- US automobile industry used to be very complacent about quality lost a significant amount of market share
   complacency about software quality could lead to the same result
- There are many recalls for automobiles some fixed for free
- There are many defects in software
  - some fixed for freesome fixed in the the next release
  - customer paying for the upgrade

Why is analysis important?

USS Yorktown

- <u>http://www.slothmud.org/~hayward/mic\_humor/nt\_navy.html</u>
   Suffered a systems failure when bad data was fed into its computers during maneuvers off the coast of Cape Charles,VA
- Ship towed into the Naval base at Norfolk,VA, because a database overflow caused its propulsion system to fail
- Took two days of pier-side maintenance to fix the problem

#### Ariane Five

- http://www.ima.umn.edu/~arnold/disasters/ariane5rep.html
- Reused a module developed for Ariane 4, which assumed that the horizontal velocity component would not overflow a 16-bit variable
- Not true for Ariane 5, leading to self-destruction roughly 40 seconds after launch

## Any questions?

#### Homework 1 coming up

- By January 29 Pick one 2-hour slot on <u>https://tinyurl.com/CS621HW1SignUp</u>
- The slots go from February 1 to 8
- The assignment will take place entirely during the slot.
- Slot selection is first-come first-served.

#### What is Homework 1?

- You will get an opportunity to analyze several real-world defects and debug them.
- You'll use modern tools to help understand and fix errors.
- The assignment will be a guided one-on-one session.

## Today's (and not only today's) plan

- Static analysis
- Dynamic analysis
- Model checking
- Mutation testing
- Bug localization
- Symbolic execution

#### Areas we will cover in this course

- Static analysis
- Dynamic analysis
- Model checking
- Mutation testing
- Bug localization
- Symbolic execution

areas for your projects

#### As we go over each topic...

- Think whether this sounds interesting
- Think about what kind of a tool you could make that uses this
- You are all programmers: think about things you've done while programming that were hard, and how these kinds of analysis might make it easier

## Static Analysis

- Two kinds we'll consider:
  - Manual
  - Automatic

## **Manual Reviews**

- Manual static analysis methods
  Reviews, walkthroughs, inspections
- Most can be applied at any step in the lifecycle
- Have been shown to improve reliability, but
  - often the first thing dropped when time is tight
  - labor intensive
  - often done informally, no data/history, not repeatable

## Reviews and walkthroughs

- Reviews
  - author or one reviewer leads a presentation of the artifact
  - review is driven by presentation, issues raised
- Walkthroughs
  - usually informal reviews of source code
  - step-by-step, line-by-line review

#### Inspections

- Software inspections
  - formal, multi-stage process
  - significant background & preparation
  - led by moderator
  - many variations of this approach

#### **Experimental results**

- software inspections have repeatedly been shown to be cost effective
- increases front-end costs
   ~15% increase to pre-code cost
- · decreases overall cost

## IBM study

- Doubled number of lines of code produced per person
  - some of this due to inspection process
- Reduced faults by 2/3
- Found 60-90% of the faults
- Found faults close to when they were introduced

The sooner a fault is found the less costly it is to fix

## Why are inspections effective?

- Knowing the product will be scrutinized causes developers to produce a better product (Hawthorne effect)
- Having others scrutinize a product increases the probability that faults will be found
- Walkthroughs and reviews are not as formal as inspections, but appear to also be effective – hard to get empirical results

## What are the deficiencies?

- Tend to focus on error detection
- what about other "ilities" -- maintainability, portability, etc?Not applied consistently/rigorously
  - inspection shows statistical improvement
- Human-intensive and often makes ineffective use of human resources
  - skilled software engineer reviewing coding standards, spelling, etc.
  - Lucent study: ½M LoCS added to 5M LoCS required ~1500 inspections, ~5 people/inspection
  - no automated support

## Automatic static analysis

What can you tell me about this code:

```
public int square(int x) {
   return x * x;
```

}

## Automatic static analysis

#### What about this code:

```
public double weird_sqrt(int x) {
    if (x > 0)
        return sqrt(x);
    else
        return 0;
}
```

## Uses of Data-Flow Analyses

- Software Engineering Tasks
   E g Debugging
  - E.g., Debugging suppose that a has the incorrect value in the statement

a=c+y

need data dependence information: statements that can affect the incorrect value at a given program point

#### Static analysis summary

- Manual or automatic
  - very different
  - manual removes bugs
- Analyze the source code to determine
  - $-\operatorname{control} \operatorname{flow}$
  - data flow
- Build reachability graphs, data dependence graphs, etc.

Dynamic analysis

- Assertions
- Detecting invariants

#### Assertions

public double area(int length, int width) {
 assert(length >=0);
 assert(width >=0);
 return length \* width;
}

## Detecting invariants

```
public int square(int x) {
  return x * x;
}
```

Let's run the code and watch it. What can we tell about it?

## Why dynamic detection?

- Is it sound?
  - If you learn a property about a program, must it be true?
- Is it complete?
  - Do you learn all properties that are true about a program?

## So why dynamic detection?

- Code can be complex - Static analysis may not scale to large programs.
- Sometimes, logs is all you have access to
  - Not all code is open source. If you use libraries, others' code, you may only be able to observe executions.
- Fast
- Detects properties of actual usage, rather than all possible usage

# What can we do with static and dynamic analyses?

- You have:
  - a program
  - some tests that pass
  - some tests that fail

# What can we do with static and dynamic analyses?

- You have:
  - a program
  - some tests that pass
  - some tests that fail

## What can we do statically?

#### Statically, we can...

- Think about the code long and hard, and fix it.
- Can we step through a failing test case? See where the code goes wrong?
  - but to automate this, we have to know where the code is "supposed" to go
- Can we reverse-engineer the conditions necessary to get to the desired result?

## What can we do with static and dynamic analyses?

• You have:

- a program
- some tests that pass
- some tests that fail

## What can we do dynamically?

#### Dynamically, we can...

- Run the code and observe which lines execute when
  - lines that execute on failings tests only are more likely buggy
- We can detect code invariants and reason about the code
- We can muck with the code and see if it does any better on the tests
