OO design principles

September 14, 2017

Today

- Code review and (re)design of an MVC application
- OO design principles
 - Information hiding (and encapsulation)
 - Polymorphism
 - Open/closed principle
 - Inheritance in Java
 - The diamond of death
 - Liskov substitution principle
 - Composition/aggregation over inheritance

Let's review the code of the following application

Source code available on the course web site

OO design principles

- **Information hiding (and encapsulation)**
- Polymorphism
- Open/closed principle
- Inheritance in Java
- The diamond of death
- Liskov substitution principle
- Composition/aggregation over inheritance

Information hiding

MyClass
+ nElem : int + capacity : int + top : int + elems : int[] + canResize : bool
+ resize(s:int):void + push(e:int):void + capacityLeft():int + getNumElem():int + pop():int + getElems():int[]

```
public class MyClass {  
    public int nElem;  
    public int capacity;  
    public int top;  
    public int[] elems;  
    public boolean canResize;  
    ...  
    public void resize(int s){...}  
    public void push(int e){...}  
    public int capacityLeft(){...}  
    public int getNumElem(){...}  
    public int pop(){...}  
    public int[] getElems(){...}  
}
```

Information hiding

MyClass
+ nElem : int + capacity : int + top : int + elems : int[] + canResize : bool
+ resize(s:int):void + push(e:int):void + capacityLeft():int + getNumElem():int + pop():int + getElems():int[]

```
public class MyClass {  
    public int nElem;  
    public int capacity;  
    public int top;  
    public int[] elems;  
    public boolean canResize;  
    ...  
    public void resize(int s){...}  
    public void push(int e){...}  
    public int capacityLeft(){...}  
    public int getNumElem(){...}  
    public int pop(){...}  
    public int[] getElems(){...}  
}
```

What does MyClass do?

Information hiding

Stack
+ nElem : int + capacity : int + top : int + elems : int[] + canResize : bool
+ resize(s:int):void + push(e:int):void + capacityLeft():int + getNumElem():int + pop():int + getElems():int[]

```
public class Stack {  
    public int nElem;  
    public int capacity;  
    public int top;  
    public int[] elems;  
    public boolean canResize;  
    ...  
    public void resize(int s){...}  
    public void push(int e){...}  
    public int capacityLeft(){...}  
    public int getNumElem(){...}  
    public int pop(){...}  
    public int[] getElems(){...}  
}
```

Information hiding

Stack
+ nElem : int + capacity : int + top : int + elems : int[] + canResize : bool
+ resize(s:int):void + push(e:int):void + capacityLeft():int + getNumElem():int + pop():int + getElems():int[]

Stack
- elems : int[] ...
+ push(e:int):void + pop():int ...

Information hiding:

- Reveal as little information about internals as possible.
- Segregate public interface and implementation details.
- Reduces complexity.

Anything that could be improved in this implementation?

Information hiding vs. visibility

Information hiding vs. visibility

- Protected, package-private, or friend-accessible (C++).
- Not part of the public API.
- Implementation detail that a subclass/friend may rely on.

OO design principles

- Information hiding (and encapsulation)
- **Polymorphism**
- Open/closed principle
- Inheritance in Java
- The diamond of death
- Liskov substitution principle
- Composition/aggregation over inheritance

A little refresher: what is Polymorphism?

A little refresher: what is Polymorphism?

An object's ability to provide different behaviors.

Types of polymorphism

- Ad-hoc polymorphism (e.g., operator overloading)
 - `a + b` ⇒ String vs. int, double, etc.
- Subtype polymorphism (e.g., method overriding)
 - `Object obj = ...;` ⇒ `toString()` can be overridden in subclasses and therefore provide a different behavior.
`obj.toString();`
- Parametric polymorphism (e.g., Java generics)
 - `class LinkedList<E> {` ⇒ A `LinkedList` can store elements regardless of their type but still provide full type safety.
`void add(E) {...}`
`E get(int index) {...}`

A little refresher: what is Polymorphism?

An object's ability to provide different behaviors.

Types of polymorphism

- Subtype polymorphism (e.g., method overriding)
 - `Object obj = ...;` ⇒ `toString()` can be overridden in subclasses and therefore provide a different behavior.
`obj.toString();`

Subtype polymorphism is essential to many OO design principles.

OO design principles

- Information hiding (and encapsulation)
- Polymorphism
- **Open/closed principle**
- Inheritance in Java
- The diamond of death
- Liskov substitution principle
- Composition/aggregation over inheritance

Open/closed principle

Software entities (classes, components, etc.) should be:

- **open** for extensions
- **closed** for modifications

```
public static void draw(Object o) {
    if (o instanceof Square) {
        drawSquare((Square) o)
    } else if (o instanceof Circle) {
        drawCircle((Circle) o);
    } else {
        ...
    }
}
```

Good or bad design?

Open/closed principle

Software entities (classes, components, etc.) should be:

- **open** for extensions
- **closed** for modifications

```
public static void draw(Object o) {  
    if (o instanceof Square) {  
        drawSquare((Square) o)  
    } else if (o instanceof Circle) {  
        drawCircle((Circle) o);  
    } else {  
        ...  
    }  
}
```

Violates the open/closed principle!

Open/closed principle

Software entities (classes, components, etc.) should be:

- **open** for extensions
- **closed** for modifications

```
public static void draw(Object s) {  
    if (s instanceof Shape) {  
        s.draw();  
    } else {  
        ...  
    }  
}
```

```
public static void draw(Shape s) {  
    s.draw();  
}
```

OO design principles

- Information hiding (and encapsulation)
- Polymorphism
- Open/closed principle
- **Inheritance in Java**
- The diamond of death
- Liskov substitution principle
- Composition/aggregation over inheritance

Inheritance: (abstract) classes and interfaces

```
SequentialList  
{abstract}
```

```
LinkedList
```

Inheritance: (abstract) classes and interfaces

LinkedList extends SequentialList

Inheritance: (abstract) classes and interfaces

LinkedList extends SequentialList

Inheritance: (abstract) classes and interfaces

LinkedList extends SequentialList implements List, Deque

The “diamond of death”: the problem

```
...  
A a = new D();  
int num = a.getNum();  
...
```

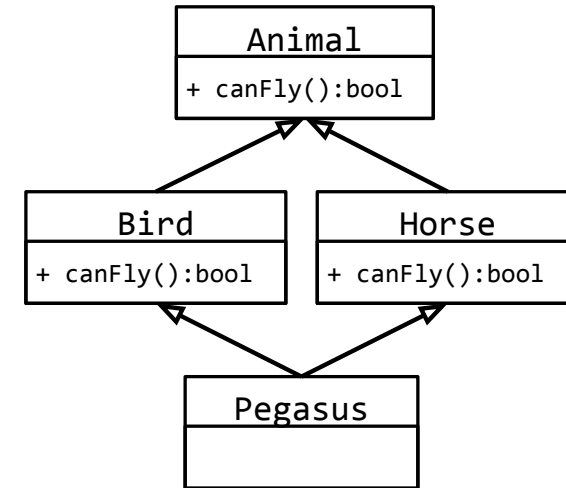

The “diamond of death”: the problem

```
...  
A a = new D();  
int num = a.getNum();  
...
```

Which `getNum()` method
should be called?

The “diamond of death”: concrete example

Can this happen in Java? Yes, with default methods in Java 8.

- Open/closed principle
- Inheritance in Java
- The diamond of death
- **Liskov substitution principle**
- Composition/aggregation over inheritance

Design principles: Liskov substitution principle

Motivating example

We know that a square is a special kind of a rectangle. So, which of the following OO designs makes sense?

Design principles: Liskov substitution principle

Subtype requirement

Let object x be of type $T1$ and object y be of type $T2$. Further, let $T2$ be a subtype of $T1$ ($T2 <: T1$). Any provable property about objects of type $T1$ should be true for objects of type $T2$.

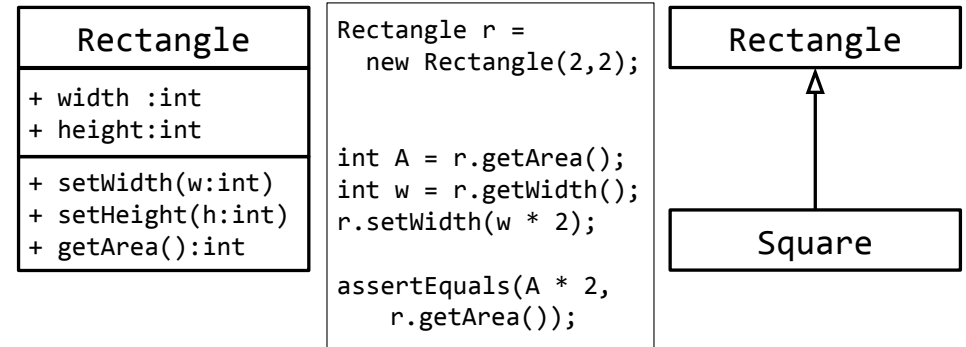

Is the subtype requirement fulfilled?

Inheritance vs. (Aggregation vs. Composition)

Design choice: inheritance or composition?

Hmm, both designs seem valid -- what are pros and cons?

Design choice: inheritance or composition?

Pros

- No delegation methods required.
- Reuse of common state and behavior.

Cons

- Exposure of all inherited methods (a client might rely on this particular superclass -> can't change it later).
- Changes in superclass are likely to break subclasses.

Pros

- Highly flexible and configurable: no additional subclasses required for different compositions.

Cons

- All interface methods need to be implemented -> delegation methods required, even for code reuse.

Composition/aggregation over inheritance allows more flexibility.
