

## CS 103: Lecture 10 Network Exchange Theory

Dan Sheldon

October 20, 2015

## Announcements

- ▶ HW 3 due Thursday
- ▶ Office hours
  - ▶ Dan Tues. 4–5
  - ▶ Areeba Tues. 7–8
  - ▶ Tiffany Wed. 8–9
  - ▶ **Poll**: are you planning to come?
- ▶ Midterm
  - ▶ Tuesday Nov 3 (two weeks from today)
  - ▶ Parts I–IV of book (Chapters 1–12, excluding 11)
  - ▶ More info on topics/format to come

## Plan for today (and Thursday)

- ▶ Network Exchange Theory
  - ▶ Motivation
  - ▶ Experiments
  - ▶ Theory (Nash bargaining)

## Power

Relationships produce value

- ▶ Friendship
- ▶ Business
- ▶ Political

**Social exchange**: how is this value divided between participants?

Division may be unequal → one party gets more value.

Why do some parties have more **power** in relationships?

- ▶ Intrinsic strength?
- ▶ Strong position in the network?

## Network Exchange Theory

**Network exchange theory** (sociology): way that positions of individuals in a social network lend *power* and lead to *social imbalance*

**Example**: who is powerful in this network? who is not?

## Network Exchange Theory

How can we model this?

A simple exchange model:

- ▶ Value of \$1 per edge
- ▶ Each node exchanges with at most one other node
- ▶ In each exchange, the parties negotiate how to split value

**Examples**: two-node path, three-node path

## Network Exchange Theory

How do sociologists study this?

- ▶ Lab experiments
- ▶ Theory

Our plan

- ▶ Experiments (activity)
- ▶ Theory

## Activity

- ▶ Everyone assigned to a node
- ▶ \$1 per edge
- ▶ Negotiate with immediate neighbors
  - ▶ With whom to exchange
  - ▶ How to split
- ▶ Repeat for ~10 minutes and record results
- ▶ **Goal:** maximize your profit. Take home average over all rounds.

## Discussion

- ▶ Draw networks on board
- ▶ Review results
- ▶ Discuss: why are some nodes more powerful?

## Theory

Can we develop a theory to predict the outcomes of network exchanges?

### **Model development on board**

- ▶ Outcome
- ▶ Stability
- ▶ Discussion of stability

## Review

### **Review**

- ▶ We introduced the ideas of network exchange and power in networks
- ▶ We conducted experiments to see how networks confer power
- ▶ We started developing a mathematical model to predict outcomes of network exchange experiments
  - ▶ Outcomes
  - ▶ Stability

**Next time:** balanced outcomes
