

# COMPSCI 311 Introduction to Algorithms

## Lecture 5: Graph Traversal

Dan Sheldon

University of Massachusetts Amherst

## Graph Traversal

Thought experiment. World social graph.

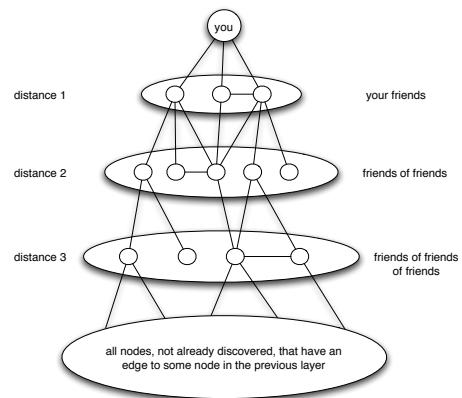

- ▶ Is it connected?
- ▶ If not, how big is largest connected component?
- ▶ Is there a path between you and King Charles III?

How can you tell algorithmically?

Answer: graph traversal! (BFS/DFS)

## Breadth-First Search

Explore outward from starting node  $s$  by distance. "Expanding wave"

## Breadth-First Search: Layers

Explore outward from starting node  $s$ .

Define **layer**  $L_i =$  all nodes at distance exactly  $i$  from  $s$ .

### Layers

- ▶  $L_0 = \{s\}$
- ▶  $L_1 =$  nodes with edge to  $L_0$
- ▶  $L_2 =$  nodes with an edge to  $L_1$  that don't belong to  $L_0$  or  $L_1$
- ▶ ...
- ▶  $L_{i+1} =$  nodes with an edge to  $L_i$  that don't belong to any earlier layer.

**Observation:** There is a path from  $s$  to  $t$  if and only if  $t$  appears in some layer.

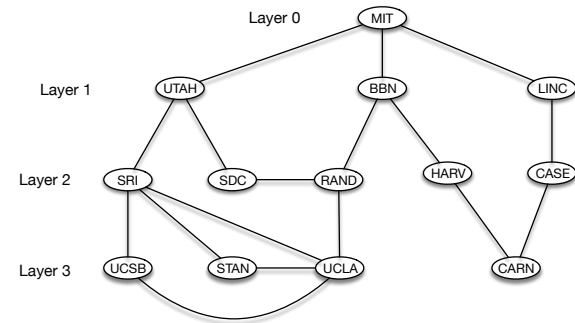

## Clicker

How many nodes are in layer 2, starting a BFS from MIT ?

- A. 4
- B. 5
- C. 6
- D. None of the above

## BFS Layers

## BFS Implementation

BFS( $s$ ):

mark  $s$  as "discovered"

$L[0] \leftarrow \{s\}, i \leftarrow 0$

**while**  $L[i]$  is not empty **do**

$L[i+1] \leftarrow$  empty list

**for all** nodes  $v$  in  $L[i]$  **do**

**for all** neighbors  $w$  of  $v$  **do**

**if**  $w$  is not marked "discovered" **then**

mark  $w$  as "discovered"

put  $w$  in  $L[i+1]$

$i \leftarrow i+1$

▷ Discover  $s$

▷ Explore  $v$

▷ Discover  $w$

Running time? How many times does each line execute?  
(For now, assume graph is connected)

## BFS Running Time

BFS( $s$ ):

mark  $s$  as "discovered"

$L[0] \leftarrow \{s\}, i \leftarrow 0$

**while**  $L[i]$  is not empty **do**

$L[i+1] \leftarrow$  empty list

**for all** nodes  $v$  in  $L[i]$  **do**

**for all** neighbors  $w$  of  $v$  **do**

**if**  $w$  is not marked "discovered" **then**

mark  $w$  as "discovered"

put  $w$  in  $L[i+1]$

$i \leftarrow i+1$

▷ 1

▷ 1

▷  $\leq n$

▷  $\leq n$

▷  $n$

▷  $2m$

▷  $2m$

▷  $n$

▷  $n$

▷  $\leq n$

Running time:  $\Theta(m+n)$

## BFS Running Time

BFS running time:  $\Theta(m + n)$

- ▶ Another way to think about it: "touch each node and edge" a constant number of times
- ▶ Hidden assumption: can iterate over neighbors of  $v$  efficiently...

## Graph Representation: Adjacency Lists

Each node keeps **list of neighbors**

- ▶ Each edge stored twice
- ▶ Space?  $\Theta(m + n)$
- ▶ Time to check if  $(u, v)$  is an edge?  $O(\text{degree}(u))$   
(degree = number of neighbors)
- ▶ Time to iterate over all neighbors of  $v$ ?  $O(\text{degree}(u))$

## Clicker

Let  $q = \sum_{v \in V} \text{degree}(v)$  (this is the sum of degrees of all nodes in the graph)

Which one of the following is false?

- A.  $q$  is twice the number of edges
- B.  $q$  is  $n$  times the average degree
- C.  $q$  is  $\Theta(m + n)$  if  $m \geq n$
- D. None of the above

## BFS Tree

We can use BFS to make a tree. (blue: "tree edges", dashed: "non-tree edges")

## BFS Tree

BFS( $s$ ):

mark  $s$  as "discovered"

$L[0] \leftarrow \{s\}$ ,  $i \leftarrow 0$

$T \leftarrow$  empty

**while**  $L[i]$  is not empty **do**

$L[i+1] \leftarrow$  empty list

**for all** nodes  $v$  in  $L[i]$  **do**

**for all** neighbors  $w$  of  $v$  **do**

**if**  $w$  is not marked "discovered" **then**

mark  $w$  as "discovered"

put  $w$  in  $L[i+1]$

put  $(v, w)$  in  $T$

$i \leftarrow i+1$

## BFS Tree

**Claim:** let  $T$  be the tree discovered by BFS on graph  $G = (V, E)$ , and let  $(x, y)$  be any edge of  $G$ . Then the layer of  $x$  and  $y$  in  $T$  differ by at most 1.

## BFS and non-tree edges

**Claim:** let  $T$  be the tree discovered by BFS on graph  $G = (V, E)$ , and let  $(x, y)$  be any edge of  $G$ . Then the layer of  $x$  and  $y$  in  $T$  differ by at most 1.

**Proof**

- ▶ Let  $(x, y)$  be an edge
- ▶ Assume  $x$  is discovered first and placed in  $L_i$
- ▶ Then  $y \in L_j$  for  $j \geq i$
- ▶ When neighbors of  $x$  are explored,  $y$  is either already in  $L_i$  or  $L_{i+1}$ , or is discovered and added to  $L_{i+1}$

## Clicker

Suppose in BFS that the nodes in each layer are explored in a different order (e.g. reverse). Which of the following are true?

- A. The nodes that appear in each layer may change
- B. The BFS tree may change
- C. Both A and B
- D. Neither A nor B

## Depth-First Search

Depth-first search (DFS): keep exploring from the most recently added node until you have to backtrack.

Dotted edges: to already explored nodes

## DFS: Recursive Implementation

```
DFS(u)
  mark u as "explored"
  for all edges (u, v) do
    if v is not "explored" then
      call DFS(v) recursively
```

## DFS: Running Time

How to analyze if algorithm is recursive? Same: count executions of each line, including recursive call

```
DFS(u)
  mark u as "explored"
  for all edges (u, v) do
    if v is not "explored" then
      call DFS(v) recursively
```

▷  $n$   
▷  $2m$   
▷  $2m$   
▷  $n$

Running time:  $O(m + n)$  same as BFS

## DFS Tree

```
 $T \leftarrow \text{empty}$ 
DFS(u)
  mark u as "explored"
  for all edges (u, v) do
    if v is not "explored" then
      put (u, v) in  $T$ 
      call DFS(v) recursively
```

**Claim:** Non-tree edges lead to (indirect) ancestors

## DFS: Non-tree edges lead to ancestors

**Claim:** Let  $T$  be the tree discovered by DFS, and let  $(x, y)$  be an edge of  $G$  that is not in  $T$ . Then one of  $x$  or  $y$  is an ancestor of the other.

**Proof:**

- ▶ Let  $x$  be the first of the two nodes explored
- ▶ Is  $y$  explored at beginning of  $\text{DFS}(x)$ ? No.
- ▶ At some point *during*  $\text{DFS}(x)$ , we examine the edge  $(x, y)$ . Is  $y$  explored then? Yes, otherwise we would put  $(x, y)$  in  $T$
- ▶  $\Rightarrow y$  was explored *during*  $\text{DFS}(x)$
- ▶  $\Rightarrow y$  is a descendant of  $x$

## Generic Traversal Implementations

Generic approach: maintain set of **explored** nodes and **discovered** nodes

- ▶ Explored = have seen this node and explored its outgoing edges
- ▶ Discovered = the "frontier". Have seen the node, but not explored its outgoing edges.

## Generic Graph Traversal

Let  $A$  = data structure of discovered nodes

Traverse( $s$ )

put  $s$  in  $A$

**while**  $A$  is not empty **do**

take a node  $v$  from  $A$

**if**  $v$  is not marked "explored" **then**

mark  $v$  "explored"

**for** each edge  $(v, w)$  incident to  $v$  **do**

put  $w$  in  $A$

▷  $w$  is discovered

**BFS:**  $A$  is a queue (FIFO)      **DFS:**  $A$  is a stack (LIFO)

## Clicker

put  $s$  in  $A$

**while**  $A$  is not empty **do**

take a node  $v$  from  $A$

**if**  $v$  is not marked "explored" **then**

mark  $v$  "explored"

**for** each edge  $(v, w)$  incident to  $v$  **do**

put  $w$  in  $A$

▷  $w$  is discovered

Suppose we run this traversal code and every node is marked explored before it terminates. Which of the following is false?

- A. Every node is marked "explored" exactly once.
- B. A single node could be put into  $A$  more than once.
- C. If  $w \neq s$ , the number of times that node  $w$  is put into  $A$  is  $\text{degree}(w)$ .
- D. It's possible that there exist nodes  $x$  and  $y$  with no path from  $x$  to  $y$ .

## Exploring *all* Connected Components

How to explore entire graph even if it is disconnected?

**while** there is some unexplored node  $s$  **do**  
  `Traverse( $s$ )`                   ▷ Run BFS/DFS starting from  $s$ .  
  Extract connected component containing  $s$

**Running time?** Still  $O(m + n)$

- ▶ Traversal of each component takes time proportional to the numbers of nodes + edges in *that* component

**Advice:** usually OK to assume graph is connected. State if you are doing so and why it does not trivialize the problem.

## Summary

- ▶ Graph traversal by BFS/DFS: basic algorithmic primitive used in many other algorithms
  - ▶ Is there a path from  $u$  to  $v$ ?
  - ▶ Find all connected components
  - ▶ Produce trees with different properties, sometimes useful in algorithms
- ▶  $\Theta(m + n)$  time
- ▶ Different versions of general exploration strategy
